

Product Information Sheet

Wondernut Mushroom 6 Plus

60 Capsules

Helps Supports Heart Health, Inhibits Cancer Cell Growth,
Boosts Immune System, Supports Chemo Patients, Heals
chromosome damage

Ingredients

Shiitake Mushroom Powder, Chaga Mushroom Powder,
Maitake Mushroom Powder, Resihi Mushroom Powder,
Turkey Tail Mushroom Powder, Cordyceps Mushroom
Powder

Wondernut's Mushroom 6 Plus is rich in minerals and vitamins. It contains **Potassium** that is an essential mineral that is needed by all tissues in the body. It is sometimes referred to as an electrolyte because it carries a small electrical charge that activates various cell and nerve functions. **Protein** is an essential nutrients for the human body. They are one of the building blocks of body tissue and can also serve as a fuel source. As a fuel, proteins provide as much energy density as carbohydrates. **Vitamin C** is required for the biosynthesis of collagen, L-carnitine, and certain neurotransmitters; vitamin C is also involved in protein metabolism. Collagen is an essential component of connective tissue, which plays a vital role in wound healing. Vitamin C is also an important physiological antioxidant and has been shown to regenerate other antioxidants within the body, including alpha-tocopherol (vitamin E). Ongoing research is examining whether vitamin C, by limiting the damaging effects of free radicals through its antioxidant activity, might help prevent or delay the development of certain cancers, cardiovascular disease, and other diseases in which oxidative stress plays a causal role. In addition to its biosynthetic and antioxidant functions, vitamin C plays an important role in immune function and improves the absorption of nonheme iron. **Vitamin B** helps the process your body uses to get or make energy from the food you eat. They also help form red blood cells. **Vitamin D** is involved in calcium absorption, immune function, and protecting bone, muscle, and heart health. **Vitamin K** is needed for the normal clotting (coagulation) of blood. Warfarin is a medicine that blocks the effects of vitamin K. This medicine helps to prevent abnormal blood clots from forming. It is used for conditions such as clots in the inflamed veins in the legs (thrombophlebitis) and blood clots in the lungs (pulmonary emboli). It helps to prevent new blood clots from forming. Too much warfarin may cause sudden bleeding. This can lead to stroke, gastrointestinal bleeding, and death.
